(budesonide) extended release tablets  
TREATMENT FOR: ULCERATIVE COLITIS

Entoris® is a different kind of treatment for ulcerative colitis. It is specifically designed to target the colon and helps eliminate the symptoms of UC, with a safety profile similar to placebo (sugar pill). Entoris® is a prescription corticosteroid medicine used to help get mild to moderate UC under control.

Treatment for: Ulcerative Colitis

Entoris (budesonide) is a glucocorticosteroid indicated for the induction of remission in patients with active, mild to moderate ulcerative colitis.

Indication for Entoris

Entoris® extended release tablets are a prescription corticosteroid medicine used to help get mild to moderate ulcerative colitis (UC) under control (induce remission).

Ulcerative colitis (UC) causes inflammation, or areas of redness and swelling, in the colon. This disturbance produces the symptoms of UC. Entoris decreases the severity of inflammation and helps to heal the lining of the colon, thereby helping to eliminate UC symptoms.

What happens after taking Entoris? Unlike typical steroids, which act on the whole body, Entoris is designed to target the area where the disease is located. The medicine travels through the digestive system and stays intact until it reaches the colon. Once it dissolves, Entoris forms a type of gel and is designed to release medicine throughout the full length of the colon.

Dosing : Entoris is taken once per day in the morning. The recommended dose for **Entoris is one 9-mg tablet.**

How should I take Entoris?

Take Entoris exactly as your doctor tells you.

Take Entoris in the morning.

Take Entoris tablets whole. Do not chew or crush Entoris before swallowing.

Entoris® (budesonide) extended release tablets are not for everyone.

**Food and Drug Administration (FDA) approved .Prescription Only (POM)**
